

M2M Conference Call

January 18, 2012

- Update on downscaling efforts- Alan
- Plant data collection and status- UCSB
- Mendeley.com document sharing- UCSB
- First look at some HOBO data- UCSB
- Data directory structure for the project- UCSB
- Microclimate data naming conventions- UCSB
- Next Conference Call (changed to): February 22, 1pm

Plant Data: Determine % of germinable seed out-planted

-Blue oak- germination tests underway in UCSB greenhouse

-Initial results- >75% already germinated
-Some loss due to fungus and desiccation

-Black oak, ponderosa, gray and Jeffrey pines- stratification treatments in cooler

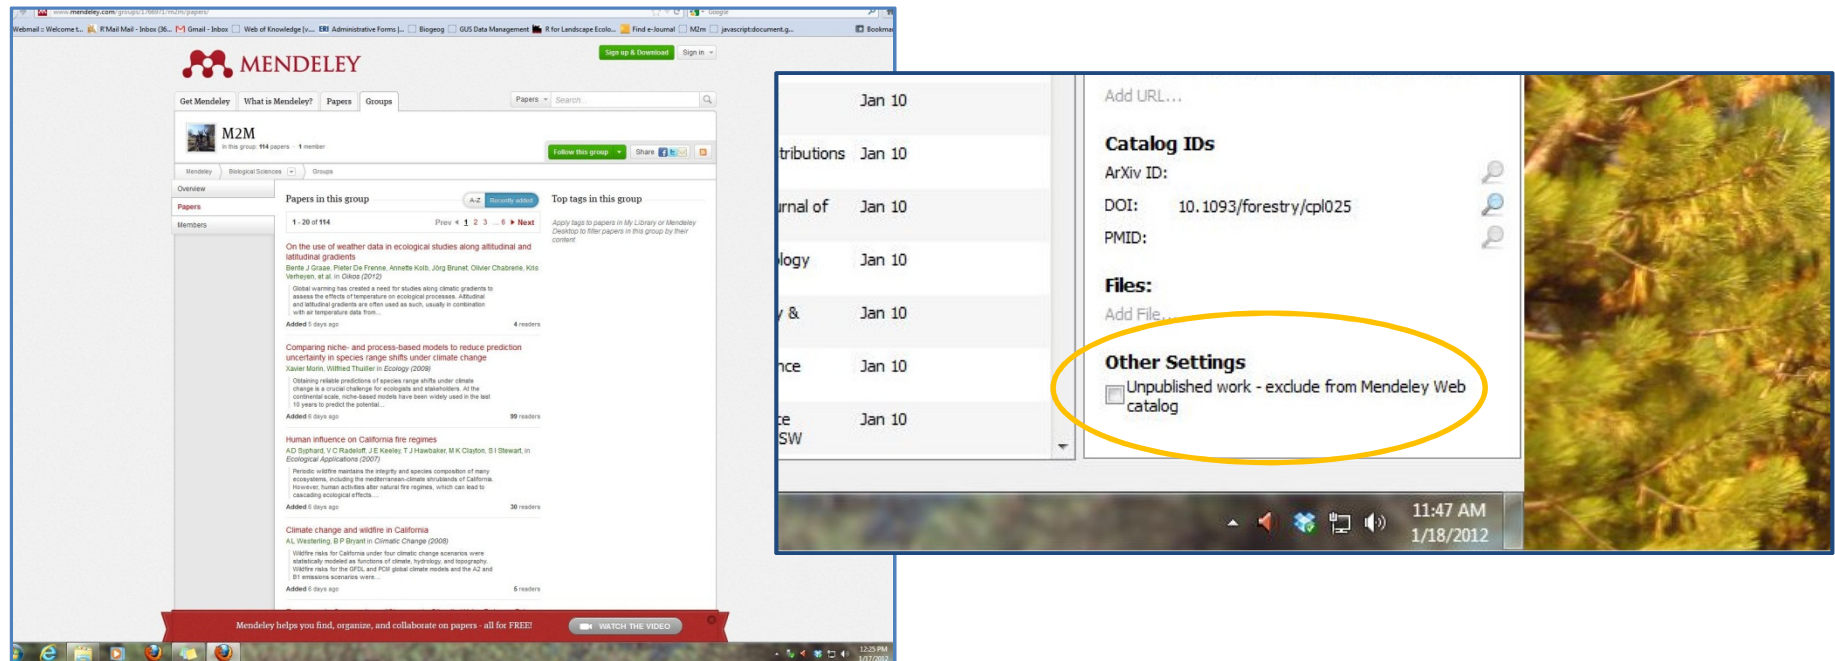

-Germination trials to begin next month

Plant Data: Growth Data Collection

- Bimonthly visits begin approximately 2/14/12
 - Weather-dependent (likely low sites-only)
- Data from each site(4), garden(6) for each seed(50)-species(5)-provenance(2):
 - Emergence, shoot height, # leaves >2.5cm, basal diameter, general condition

Reference and Document Sharing

- Mendeley Library on Wiki
- To share citations- no login required
- To share PDFs- login must be created
- Who is interested?

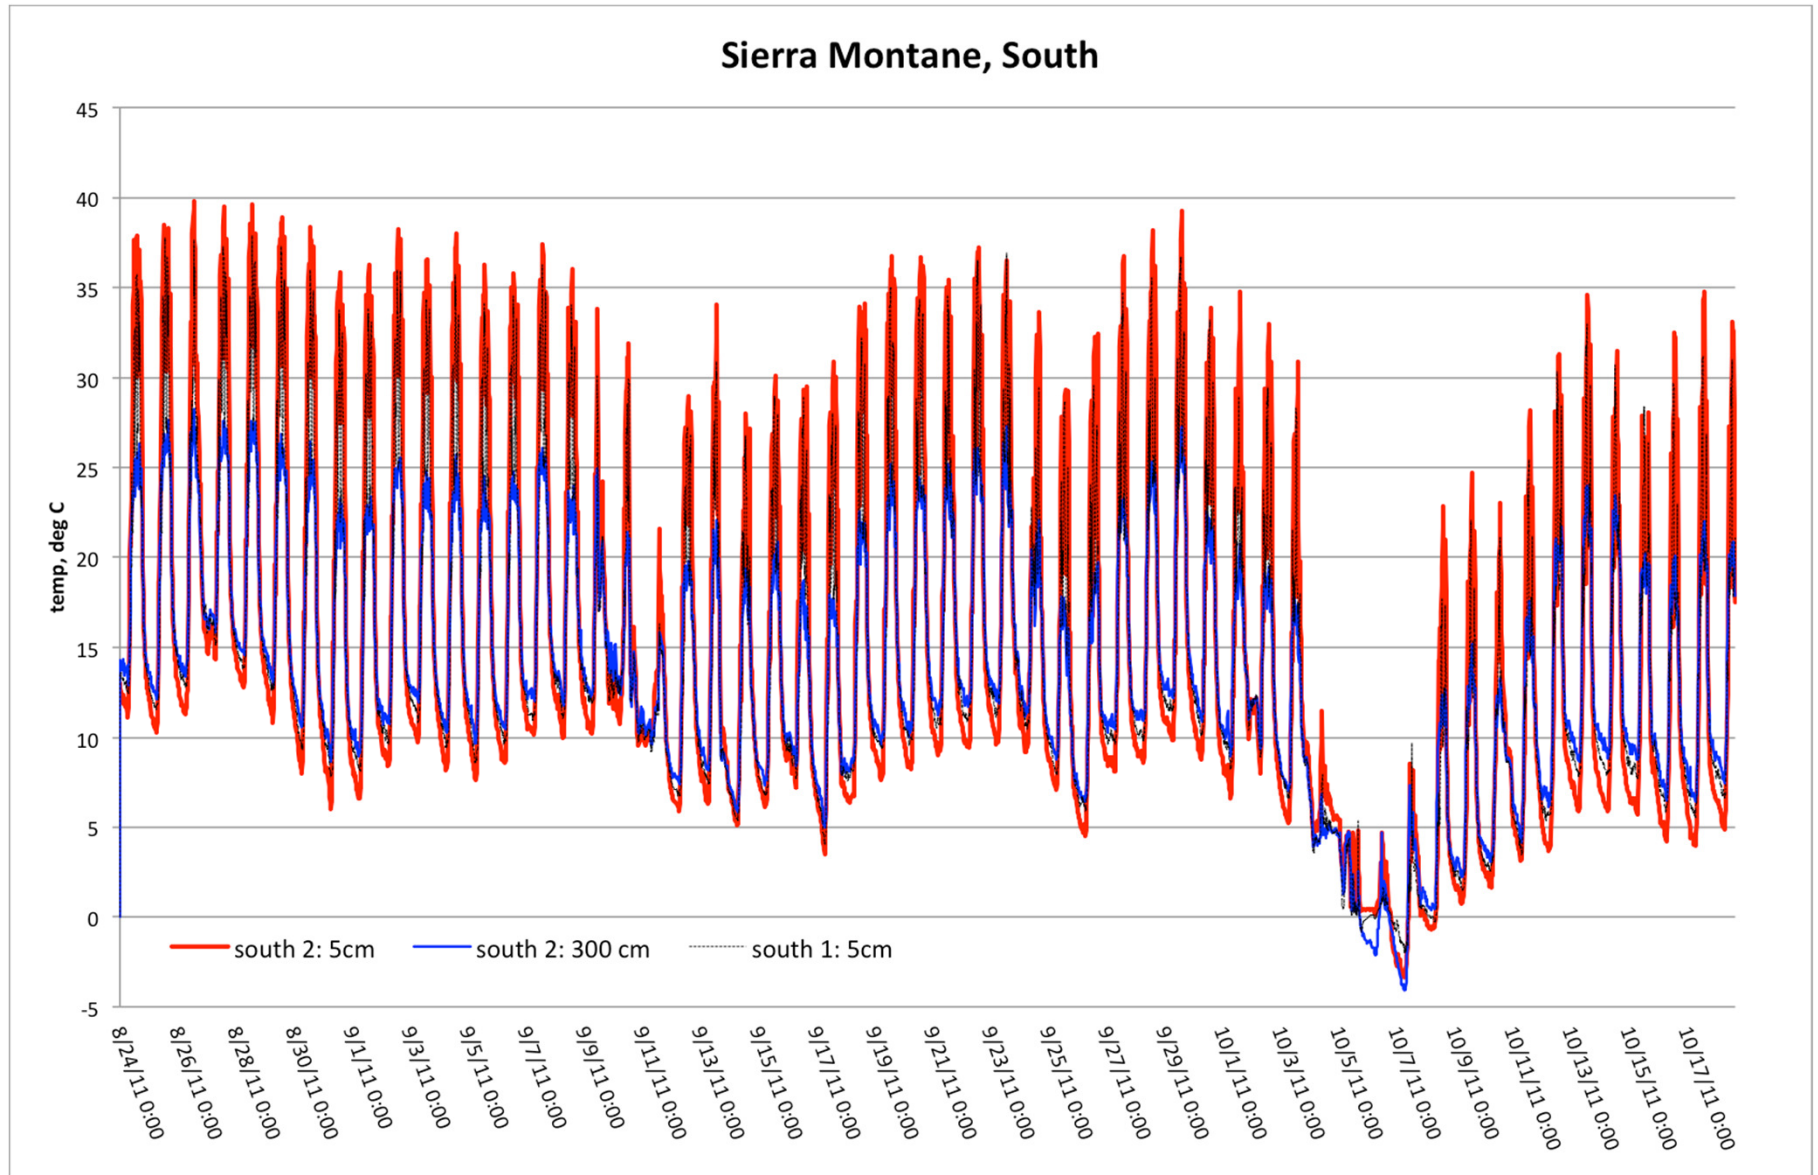

Preliminary HOBO data

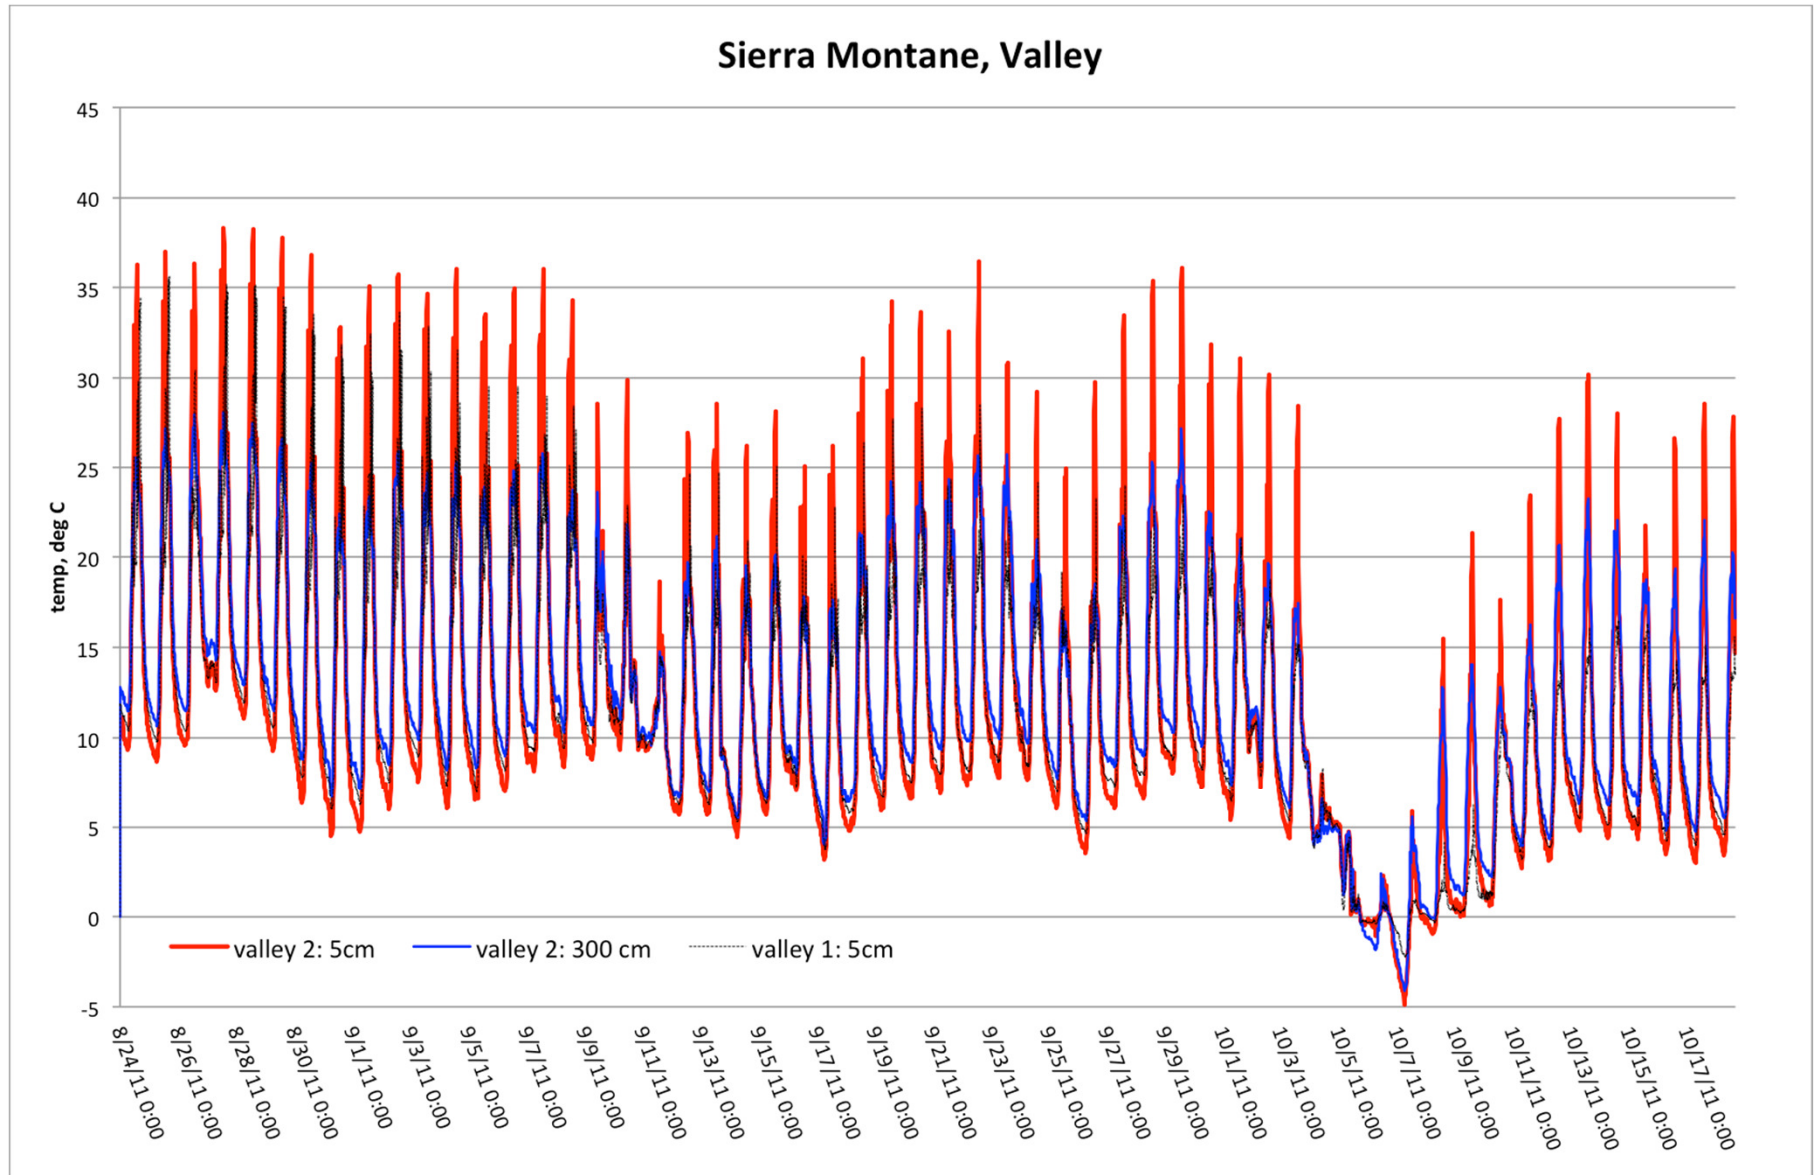

Preliminary HOBO data

Preliminary HOBO data

Preliminary HOBO data

Preliminary HOBO data

Preliminary HOBO data

Preliminary HOBO data

Preliminary HOBO data

Preliminary HOBO data

Red line = temp diff at same location
btw 3m and 5cm sensors

Blue line = temp diff between paired
gardens of same topo-position (N1 vs
N2, S1 vs S2...), as measured at 5cm

Preliminary HOBO data

Red line = temp diff at same location
btw 3m and 5cm sensors

Blue line = temp diff between paired
gardens of same topo-position (N1 vs
N2, S1 vs S2...), as measured at 5cm

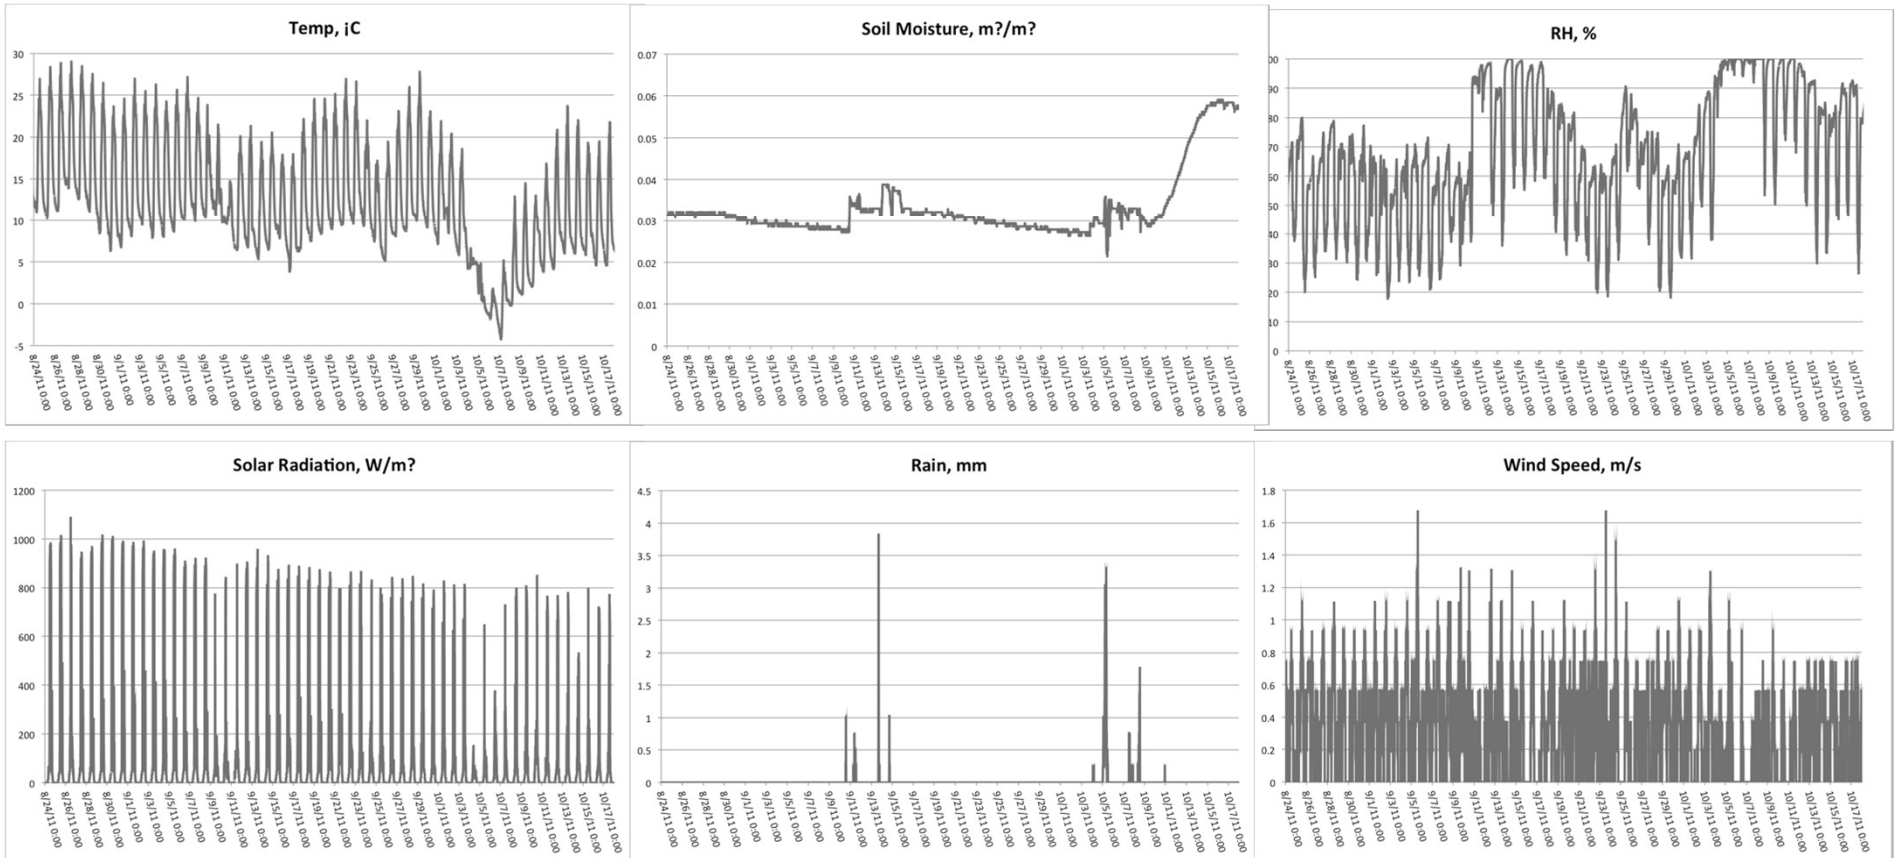

Preliminary HOBO data

Red line = temp diff at same location
btw 3m and 5cm sensors

Blue line = temp diff between paired
gardens of same topo-position (N1 vs
N2, S1 vs S2...), as measured at 5cm

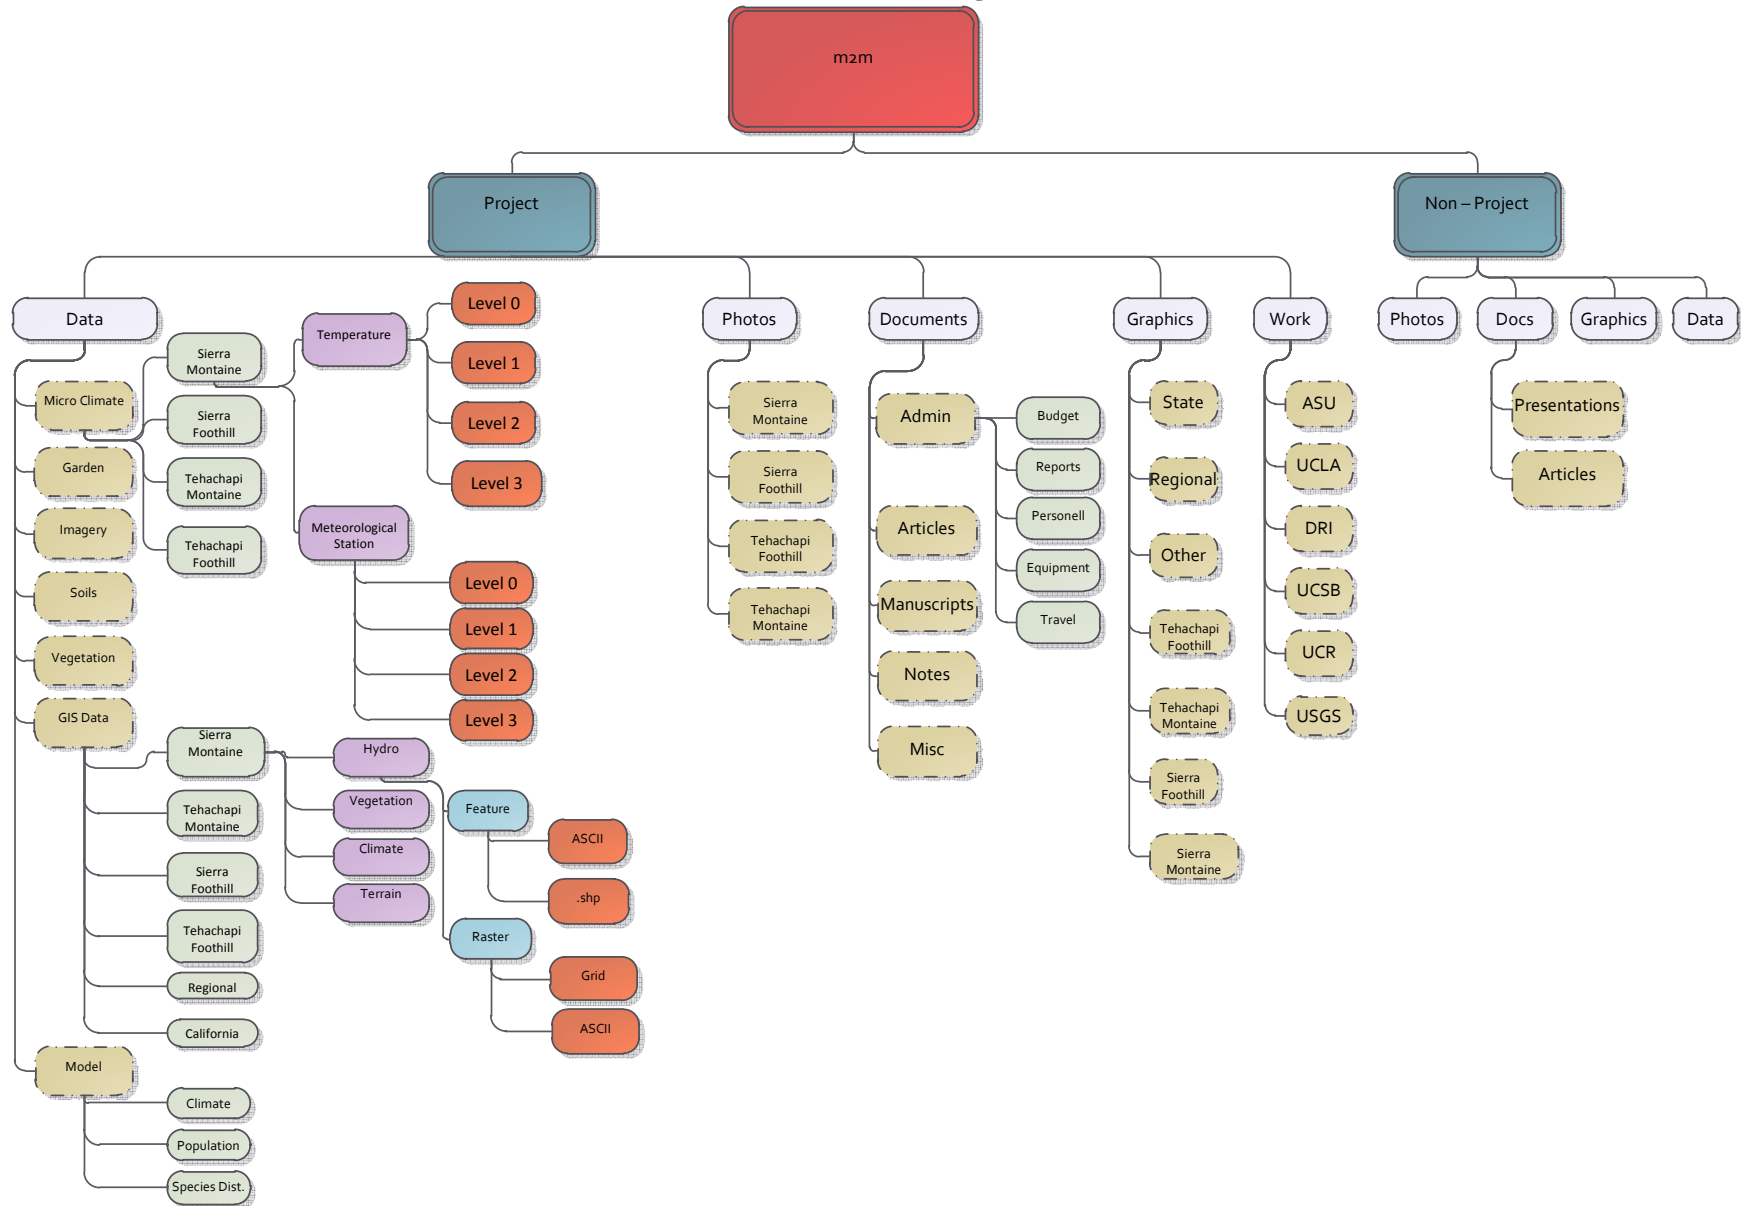

Preliminary HOBO data

Weather station data from Sierra Montane garden 3 (valley/CAP)

Data Directory Structure

Data Levels

Data Level	Description	File Format	Nomenclature (example)
Level 0	Raw climate data	.hobo / .csv	09987261.hobo / 09987261.csv
Level 1	Data: calibrated, QA/QC-ed, and cleaned-up	.csv	09987261_20110827_20111027.csv
Level 2	Data: calibrated, QA/QC-ed, cleaned-up, and concatenated	.csv	temp_sm408_1_20110827_20120714.csv
Level 3	TBD	.csv	TBD

Nomenclature

a. `type_sitegardenposition_height_startdate_stopdate.csv`

i. **Type:** refers to type of sensor.

1. Temperature (**temp**), or Weather Station (**met**)

ii. **Site:** refers to the site at which the sensor is located

1. **sm** = Sierra Montane, **sf** = Sierra Foothill, **tm** = Tehachapi Montane, **tf** = Tehachapi Foothill

iii. **Garden:** (1 – 6) refers to the garden at which the sensor is located. (7) refers to sensor on the Landscape array. Gardens 1 – 3 refer to gardens containing weather stations. Gardens 4 – 6 refer to gardens without weather stations. Gardens 1 & 4 refer to a north facing garden. Gardens 2 & 5 refer to south facing gardens. Garden 3 & 6 refer to valley, cold air pool, or ridge gardens.

iv. **Position:** (00 – 53) Refers to the position of the sensor within or around the garden or on the landscape.

1. Vertical station / weather station = **00**
2. Inner 15m ring = **01 – 12**.
3. Outer 40m ring = **13 – 20**.
4. Landscape array = **20 – 38** (**53** at Sierra High)

v. **Height:** refers to height of sensor above the ground.

1. **0** = ground level (~2 – 10cm)
2. **2** = 2 meter level
3. **3** = 3 meter level
4. **4** = 4 meter level

vi. **StartDate:** refers to the date when sensor was installed and data collection began.

1. Format: **yyyymmdd**

vii. **StopDate:** refers to the most recent date when data was downloaded from sensor or when data collection ended.

1. Format: **yyyymmdd**

- Example of a temperature sensor datafile after calibration, QA/QC, and concatenation:

- `temp_sm604_1_20111025_20130602.csv`
